

Figure 1 displays four panels of simulated radio spectra, labeled 0, 1, 2, and 3, corresponding to redshifts $z=0$, $z=1$, $z=2$, and $z=3$ respectively. The y-axis represents frequency in MHz (1 to 10), and the x-axis represents intensity in dB relative to cosmic background (0 to 20). The spectra show a series of horizontal lines representing the emission lines of the galaxy, with the intensity decreasing as redshift increases.
